                                                                                    The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been modified using mutagenic primers. The gene sequence was redesigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + C% of the GOR gene was reduced from 56% in the manipulated version (Q20833) to 52% in the manipulated version that wild type GOR enzyme. It was obtd. From bacterial isolate LBAA.

It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively. controlled in fields contg. crops.

                                                                                                                                         The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been manipulated such that it is suitable for introduction into and expression in plant transformation vectors, but it still encodes the wild type GOR enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. See also Q20832-Q20841 and Q22705.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            identical
                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to chance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. This sequence (fig 2) contains apparent discrepancies (see feature table) with a supposedly identical sequence (SEQ ID No.3 in the specification), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. This sequence (SEQ ID No.3 in the specification) contains apparent discrepancies (see feature table) with a supposedly identical sequence (fig 2), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of the gene encoding a glyphosate oxidoreductase (GCM) enzyme, the gene sequence was synthesised so that it could be redesigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + CA for the synthetic gene is 51% and the potential to form short, high energy, hair-pin structures is reduced. However it still encodes the wild type GOR enzyme. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that they express the controlled in fields contg. crops.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel sugar beet plant, including its descendants expressing 5-enoloyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capa of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Caps

A chemically inducible plant gene expression cassette which comprises an inducible promoter linked to a gene (I) that confers resistance to a herbicide, is calaimed. (I) imparts resistance to N-phosphonomethyl.

Glycine (glyphosate) or its salts, but may also be a gene for resistance to, e.g. chloroacetanilides, glufosinate, sulphonyl ureas, imidazolones, cet. The inducible promoter (e.g. alch, alck, alch or other alck-induced gene promoter) is operatively linked to an alck regulator sequence.

Induced expression of (I) avoids the risk that constitutive expression of (I) avoids the risk that constitutive expression of controlled by herbicide applied without inducer and minimises the chance that herbicide-resistant strains of weeds will arise. The expression cassette is strictly controlled and suitable for general use in plants (both mono- and dicotyledons). The alchAalck gene switch was exemplified with genes conferring resistance to glyphosate. The switch was used to sylthogen inducible expression of glyphosate oxidase (GOX) in plants.

Switchable GOX was expressed alone or in conjunction with constitutive expression of 5-enol-pyruvylshikimate 3-phosphate (BPSPS) CP4. Constructs were optimised for expression in mono- and dicotyledonous crop species. The present sequence comprises a fusion of the COX gene fused to the chloroplast transit sequence a from Arabidopsis RUBISCO (CPT1). This sequence was ligated into pwJB1 (see T8566) and used in construction of
                                                                                                                                                                  expression cassette; inducible promoter; alcA; alcA; regulator; alcAol dehydrogenase; herbicide resistance gene; glyphosate; n-phosphonomethyl-glycine; glyphosate, GOX; EPSPS; 5-enol-pyruvylshikimäte 3-phosphate CP4; chloroplast transit sequence 1; Arabidopsis; RUBISCO; CPT1; dicotyledon; monocotyledon; crop; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chemically inducible cassette for expressing herbicide resistance gene in plants - and derived plants, partic. for resistance to glyphosate, avoids constitutive expression and minimises development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1631 BP; 342 A; 454 C; 381 G; 454 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel sugar beet plant, including its descendants expressing 5-anolpyruvjehikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

                                                                                                                                                                                                                                                                              descendants expressing 5-enolpyruvyjshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

This sequence was isolated from a combination of three subcloned EcoXI fragments derived from the ySSRP clone lambda-yPt, to yield a sequence of 3292

bp. An open reading frame contiguous with the reading frame for the beta-galactosidase gene of lambda phage was found in the lambda-yPt DNA sequence. The polyadenylation signal is the same as that found in 50% of S. cerevisiae genes. Translation of the open reading frame yields an amino acid sequence of 534 residues. This peptide sequence is known as fractional ySRP (fySSRP). fySSRP contains eight runs of five or more Glu residues, of which the longest contains fifteen residues. The sequence contains a total of 110 Glu residues which comprises one fifth of the total. Fifty Asn residues accounts for

                                                                                                                                                                                                                 This sequence encodes a DNA structure specific recognition protein (SSR21) isolated from Saccharomyces cerevisiae clone lambda ypT which is used in a novel method for predicting whether an agent that damages DNA will also be cytotoxic, and for predicting whether particular eukaryotic cells will be susceptible to killing by a genotoxic drug. SSRP's bind to genomic lesions formed by chemotherapeutic agents, particularly cisplatin particularly cisplatin particularly cisplatin particularly cisplatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GGCATTACAACCACTAACGGTGTTCTGGCTGTTGATGCAGCTGTTGTTGCAGCTGGTGCA 768

                                                                                 The present sequence represents the CDNA sequence of the murine OPA gene. The human OPA gene is derived from the PCTG4 region of chromosome X413. Polymorphism in this region are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroidism. One 12 bp insertion polymorphism occurs within the coding region of the human OPA gene, and introduces a 4 amino acid insertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another Polymorphism consists of a pentanuclectide repeat approximately 7 kb upstream of the 12 bp polymorphism. Another polymorphisms consists of a pertanuclectide repeat approximately 7 kb upstream of the 12 bp polymorphism. The specification describes a method for screening for polymorphisms in a percification describes a method for screening for polymorphisms in a percification describes a method for screening for polymorphisms in a percification describes of the X chromosome have polymorphisms associated with neuropsychiatric disorders. The methods can be used to serve for the presence of a heritably linked form of methods can be used to a percification of the X chromosome have polymorphisms associated with neuropsychiatric disorders. The methods can be used to a peritably linked form of methods.

This is the nucleotide seqence of the expression vector pAC3A1 contg. the gene encoding the human collagen type III alpha-1 chain. The collagen gene is under control of a synthetic polyhedrin promoter (T16503-6) and is linked to the mellitin signal peptide sequence for ease of purification. The vector is used to express human collagen in insect cells, sep. Spodoptera frugiperda Sf9 cells. The cells have the ability to hydroxylate prolines in the collagen which is produced as a triple stranded molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       986 ATGTGCTCTATACGCACGCTCGAAAACTTCTTCCAGCCCTCGCGCCTGCGAGTTCTGAAG 1045

                                                                                                                                                                                                                                                                                                                                     Gaps
                                            Compared with interferon beta prepd. by recombinant methods, the INFs of the invention are more active and have different affinities for cell surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and stability. They are also easier to recover from incubation mixts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       565 AAGGGCATTCTTATAGAAGAAGGGTCACACGATTAATCCGCAAGGGCTCGTGACCCTC

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: on by sp, the same strain used for the BDGP's pl and BST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

3'); double-stranded CDNA was ligated to Eco RI adaptors [AATTCGGATCCTTG], digested with Not I and cloned into the Not I and Eco RI sites of the modified pr773 vector. Library constructed by Bob Barstead. The C2C12 cell line (available from ATCC, catalog # CRL-1772) differentiates rapidly, forming contractile myotubes and producing characteristic muscle proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Vector: pBlueScriptII SK(+) Vector; Site_1: EcoRI; Site_2: XhoI; The appressorium formation-specific cDNA library was constructed form conidia germinated for 5-8 hr on an inductive surface. The library has an average insert size of 1.5 kbp." 3 others
